

Safe Floor, Clean Floor?...

One Slip every 3 minutes...

There is one serious slip accident every 3 minutes and most serious accidents are caused by slips according to the HSE. Slips usually occur when a floor that has not been cleaned properly gets wet.

Guess how safe this old floor is...

We are told to buy safe flooring, but most of your floors are not brand new, and you don't know if they have been looked after or how safe they are. Some floors seem safe, others do not. Some days a part of the floor seems slippery. Wouldn't it be great to take know?...

Is my cleaning regime effective?...

Measuring your floors will help you to understand any changes over time and the causes of those changes. You will be able to monitor the effectiveness of your cleaning regime and you will know when a floor may require treatment or a deep clean.

Can I trust my cleaners?...

You should build a relationship of trust with your cleaners. SlipAlert will help you and your cleaners to know when floors are clean or when one area of floor needs special cleaning. Periodically you can independently check the results with SlipAlert borrowed from the HSE.

Moving dirt around or cleaning...

You can measure the effectiveness of your cleaning regime and you can quickly and easily test your floor safety.

Won't testing increase my costs?...

You can lease or purchase SlipAlert from just £50 per month or you can hire one for a week or ask your local HSE office to lend you one. The knowledge you will gain could save you money on flooring, floor treatment and will improve the quality of your floor safety and cleaning regime.
